

PowerOn Midwest—Supporting Jackson County reliability

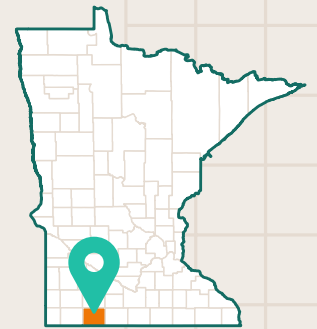

PowerOn Midwest strengthens reliability across the Midwest and in Jackson County by moving electricity from where it is generated to where it is needed in real time. This flexibility helps Minnesota maintain reliable, around-the-clock electric service at the lowest practical cost.

Jackson County

Load GWH		Generation GWH		Imports	Exports
Current year	+20 years	Current year	+20 years	% of time	% of time
246	286	708	964	38%	62%

Jackson County has substantial generation resources—about **three times** its electric load—but those generation resources are not always available. For example, wind power is only available when wind is blowing and batteries are only available when charged. Providing access to the lowest-cost available generation maintains reliable and affordable electricity around-the-clock.

Jackson County's generation resource is primarily wind generation, which supports local reliability when it's available, and surplus power can be exported to areas that need it. When Jackson County's generation is not available, Jackson County imports power through the transmission grid from other parts of Minnesota and beyond. **Today, Jackson County exports power about 62% of the time and imports power about 38% of the time.** In the future, as electric demand grows and the regional generation fleet becomes more dependent on wind, solar, and natural gas resources, the existing transmission grid lacks sufficient capacity to move power into and out of Jackson County reliably. PowerOn Midwest provides a high-capacity reliable electric backbone to move power across Minnesota.

Minnesota both imports and exports electricity, but over the course of a year, it is a **net importer**. Over the past decade, **generation outside the state served 10–20% of Minnesota's electricity needs¹**, a consistent trend expected to continue over the next 20 years. As electricity demand grows and the Midwest generation fleet evolves, more power will need to move into and out of Minnesota to maintain reliability. Together, **PowerOn Midwest and the Minnesota transmission grid are expected to bring more power into the state than leaves it.**
