

PowerOn Midwest—Supporting Martin County reliability

PowerOn Midwest strengthens reliability across the Midwest and in Martin County by moving electricity from where it is generated to where it is needed in real time. This flexibility helps Minnesota maintain reliable, around-the-clock electric service at the lowest practical cost.

Martin County

Load GWH		Generation GWH		Imports	Exports
Current year	+20 years	Current year	+20 years	% of time	% of time
431	488	1472	5326	39%	61%

Martin County has substantial generation resources—about **four times** its electric load—but those generation resources are not always available. For example, wind power is only available when wind is blowing and solar is only available when the sun is shining. Providing access to the lowest-cost available generation maintains reliable and affordable electricity around-the-clock.

Martin County's generation resource is primarily wind generation, which supports local reliability when it's available, and surplus power can be exported to areas that need it. When Martin County's generation is not available, Martin County imports power through the transmission grid from other parts of Minnesota and beyond. **Today, Martin County exports power about 61% of the time and imports power about 39% of the time.** In the future, as electric demand grows and the regional generation fleet becomes more dependent on wind, solar, and natural gas resources, the existing transmission grid lacks sufficient capacity to move power into and out of Martin County reliably. PowerOn Midwest provides a high-capacity reliable electric backbone to move power across Minnesota.

Minnesota both imports and exports electricity, but over the course of a year, it is a **net importer**. Over the past decade, **generation outside the state served 10–20% of Minnesota's electricity needs¹**, a consistent trend expected to continue over the next 20 years. As electricity demand grows and the Midwest generation fleet evolves, more power will need to move into and out of Minnesota to maintain reliability. Together, **PowerOn Midwest and the Minnesota transmission grid are expected to bring more power into the state than leaves it.**
